Recursions.

↳ functions that call themselves are called recursive functions

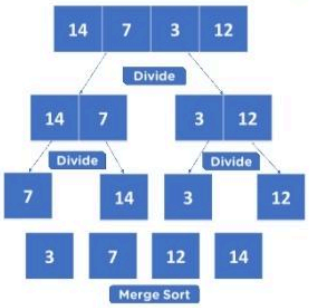

called recursive functions

* A recursive function has ① a base condn
② the recursive function call
③ Updated arguments in the recursive call.

Common recursive patterns

- print all → take/not-take method
- print any 1 → use return true & return false in the base case
- find count → use return 1 and return 0 in the base case.

* Merge Sort using recursion.

→ Merging of 2 arrays means creating a single array in sorted order using the 2 given arrays
